

## Case Study: Allied Universal AUS.com

*Created by David McKillen, Basebuild, Inc.*

### Client Overview

AUS (Allied Universal Services) is a large-scale national security firm requiring a modern, scalable, and secure website. They needed to present their wide array of services while maintaining compliance and performance across high-traffic regions.

### The Challenge

The previous site architecture lacked scalability and wasn't optimized for mobile or accessibility. Given the company's scope and the trust placed in them, the site needed to reflect professionalism, clarity, and security.

### Our Solution

Basebuild delivered a robust Drupal implementation built to handle enterprise-level content needs. We created flexible content types and custom components for case studies, services, hiring pages, and region-specific content. Security and performance were prioritized at every level, with optimization for Core Web Vitals and WCAG accessibility compliance.

## Case Study: Allied Universal AUS.com

---

### Server and tech stack:

- Hosted on Amazon Web Services (AWS), leveraging AWS's robust infrastructure for scalability and reliability.
- Built using Drupal, an open-source CMS known for its flexibility and security, which is suitable for enterprise-level websites like Allied Universal's.
- Employs Cloudflare for content delivery network (CDN) services, enhancing site speed and security by distributing content across global servers.

### Results

- Modernized, mobile-optimized Drupal website
- Improved content manageability for internal teams
- Scalable and secure infrastructure ready for national traffic
- Clearer UX and hiring flows to support ongoing talent acquisition

### Why it matters

This project illustrates Basebuild's ability to deliver secure, scalable Web solutions with a high standard of polish. By building with Drupal, we provided AUS with a durable platform to support their growing national presence.
